

A Condition optima

$n_{\text{opt}} = 3, q = 1$; best channel depends on the condition

$c \backslash s$	s_1	s_2	s_3
c_1	$s_{c_1}^*$	×	×
c_2	×	$s_{c_2}^*$	×
c_3	×	×	$s_{c_3}^*$

No single optional channel is best for all conditions

B Fixed allocation

Example: $s = s_2$ for every condition

$c_1 \rightarrow s_2$ excess $+\Delta_1$

$c_2 \rightarrow s_2$ condition best

$c_3 \rightarrow s_2$ excess $+\Delta_3$

Every fixed s has at least one mismatch

C Label-aware policy

Condition-label access guides channel changes

$c_1 \rightarrow s_1 = s_{c_1}^*$

$c_2 \rightarrow s_2 = s_{c_2}^*$

$c_3 \rightarrow s_3 = s_{c_3}^*$

Transition losses enter each condition-specific loss

$$L_{\rho}(\pi_s) - L_{\rho}(\pi_{\text{label}}) \geq \sum_{c \in C_{\text{mis}}(s)} \rho_c \Delta_c > 0$$
